# Active sensing and its application to neuromorphic space imaging

Gregory Cohen – ICNS, WSU

# Important Points

- The importance of active sensing
- The importance of prediction in neuromorphic systems
- Temporal resolution makes up for spatial resolution
- The importance of synchronization
- Biologically inspired – not biologically plausible
- Low-power, low-bandwidth sensing and computation

# What is space situational awareness?

# Space Situational Awareness

# Neuromorphic Event-based Sensors

## Novel imaging paradigm

- Independent and asynchronous pixels
- Logarithmic change detection gives very high dynamic range
- Frame-free imaging with no fixed integration times
- High-speed imaging (events have 1  $\mu\text{s}$  resolution)
- Greatly reduces motion blur and saturation effects

**High-speed, low-power, low-bandwidth imaging**

**Requires a new approach to processing and computer vision**
